SUMMARY

SUMMARY

I'm a Computer Science & Engineering student who genuinely enjoys coding and solving real-life problems which is exactly what drew me to IT roles focused on in-house system development. My experience building full-stack applications from scratch has taught me to think close to the problem: understanding what a system needs to do, then designing and implementing it myself. I'm particularly drawn to environments where systems are built in-house rather than patched together from third-party tools, where the code actually shapes how a business runs.

SKILLS

Technical Skills — Python | C | Java | OOPS | ML | Linux | Tableau | HTML | SQL | DBMS | Django Framework | Flutter | GitHub | REST API

Soft Skills — Leadership | Team Collaboration | Analytical Thinking | Active Listening | Effective Communication | Decision Making

Languages

English
(Proficient)

Malayalam
(Native)

Hindi
(Basic)

EDUCATION

Bachelor of Technology in Computer Science & Engineering 2022 – 2026
Viswajyothi College of Engineering and Technology
CGPA: 8.96
Add On Course: Bachelor of Technology in Electronics and Communication (Minor)
Higher Secondary Education in Computer Science 2020 – 2022
St Joseph's Higher Secondary School
Percentage: 97.8

INTERNSHIPS

REVERTECH 07/2024 | ERNAKULAM
Python and Machine Learning Internship

- Validated application outputs by performing functional and scenario-based testing on ML models.
- Identified edge cases and anomalies, improving model reliability and accuracy.
- Assisted in developing, testing, and maintaining backend components under guidance

Pacelab 06/2025 – 08/2025 | Kochi, Kerala
Marketing Intern

- Assisted in planning and executing digital marketing campaigns to promote different training programs.
- Created and scheduled content across social media platforms to increase brand visibility and student engagement.
- Conducted market research to identify target audiences and support lead generation efforts.

ACADEMIC PROJECTS

MAIN PROJECT

06/2025 – 05/2026

Obturo-EV-Intelligent EV Charger Booking and Management System

Product Owner & Developer | Python | Django | REST APIs | Flutter | SQLite | HTML | Jun 2025 – May 2026

- Identified core user pain point: EV owners overwhelmed by fragmented charging station data across price, distance, and availability.
- Defined functional requirements and architected a unified, API-driven platform to consolidate station information under a single interface.
- Led end-to-end product lifecycle — from problem definition and solution design to development, API integration, and deployment.
- Evaluated and integrated third-party RESTful APIs for real-time booking and live status data, replacing the need for multiple external touchpoints.
- Reduced user search-to-booking time by 30% — measured against baseline list-based systems — through iterative UI and backend improvements.
- Maintained structured documentation for system flows, API contracts, and known issue logs to support ongoing maintenance and team handover

MINIPROJECT

09/2024 – 04/2025

Disease Prediction and Department Recommendation System | Healthsphere | Machine Learning

- Scoped and defined requirements for an ML-powered web application that helps users navigate complex health symptoms without delay.
 - Translated user needs into a backend-driven architecture: symptom input → Naive Bayes prediction → department recommendation + precautions.
 - Managed trade-offs between model accuracy, response speed, and usability — iterating on the product based on test outcomes.
 - Built and documented the full data pipeline from symptom collection to automated health insights, enabling faster access to preliminary guidance.
 - Wrote clear system documentation covering model logic, architecture decisions, and deployment process for future contributors
- Stack : Python | ML-Naive Bayes | Django | HTML5 | CSS
